

Scala in Practice

lab 08

Acceptance criteria:

Create Facebook app in Scala:

- Attach any *Facebook Graph API client*. Code below is based on *RestFB*¹ (version 3.0.0) written in Java:
 - *Build.sbt*:

```
...  
libraryDependencies += "com.restfb" % "restfb" % "VERSION"
```

- **object** FacebookAdapter {
 private val myAppSecret = ??? //any String (or Notel)

 class MyFacebookClient(currentAccessToken: String)
 extends DefaultFacebookClient(
 currentAccessToken,
 myAppSecret,
 Version.VERSION_5_0) {
 //currentAccessToken is any String (or Notel)
 ...
 }
 ...

 def getUser(accessToken: String, id: String) = ... {
 val client = **new** MyFacebookClient(accessToken)
 val user = client.fetchObject(id, classOf[User])
 user
 }
 }

- Create abstractions to support functionality:
 def compareLikes(logFile: String,
 user1: String, user2: String): Unit = ???

 //All computations should run in parallel:
 //1. Get user with id=user1
 //2. Get user with id=user2
 //3. Extend file (or create new file if not exist) in
 path=logFile with line: \$CURRENT_TIME \$user1 \$user2

¹ <https://restfb.com/documentation/>

Scala in Practice

lab 08

```
//4. Print on screen:  
  ${user1.name}, likes: ${user1.getLikes.getTotalCount} vs.  
  ${user2.name}, likes: ${user2.getLikes.getTotalCount}
```

- Create *application entry-point* object with some example run of *compareLikes* functionality

Note1: (Grade will be based only on code-review) For integration testing with Facebook your app needs to be registered - values *accessToken* & *appSecret* should be provided by Facebook.

Google: "*How to get facebook access token*".

Note2: Dont use any **nulls** & **vars**
